NOTICE: SAVE THESE INSTRUCTIONS

VERMONT CASTINGS

Intrepid FlexBurn® Wood Burning Stove
Model 2115 / 2115-CAT

Installation and service of this appliance should be performed by qualified personnel. Hearth & Home Technologies recommends HHT Factory Trained or NFI certified professionals.

NOTE
To obtain a French translation of this manual, please contact your dealer or visit www.vermontcastings.com
Pour obtenir une traduction française de ce manuel, s’il vous plaît contacter votre revendeur ou visitez www.vermontcastings.com

WARNING
If the information in these instructions is not followed exactly, a fire may result causing property damage, personal injury, or death.

- Do not store or use gasoline or other flammable vapors and liquids in the vicinity of this or any other appliance.
- Do not over fire - If appliance or chimney connector glows, you are over firing. Over firing will void your warranty.
- Comply with all minimum clearances to combustibles as specified. Failure to comply may cause house fire.

WARNING
HOT SURFACES!
Glass and other surfaces are hot during operation AND cool down. Hot glass will cause burns.

- Do not touch glass until it is cooled
- NEVER allow children to touch glass
- Keep children away
- CAREFULLY SUPERVISE children in same room as fireplace.
- Alert children and adults to hazards of high temperatures
- High temperatures may ignite clothing or other flammable materials.
- Keep clothing, furniture, draperies and other flammable materials away.
Safety Alert Key:

- **DANGER!** Indicates a hazardous situation which, if not avoided will result in death or serious injury.
- **WARNING!** Indicates a hazardous situation which, if not avoided could result in death or serious injury.
- **CAUTION!** Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.
- **NOTICE:** Indicates practices which may cause damage to the appliance or to property.

Please read this entire manual before you install and use your new room heater. Failure to follow instructions may result in property damage, bodily injury, or even death.

The Intrepid FlexBurn® Wood Appliance meets the U.S. Environmental Protection Agency’s crib wood emission limits for wood appliances sold after May 15, 2020.

This wood appliance needs periodic inspection and repair for proper operation. It is against federal regulations to operate this wood appliance in a manner inconsistent with operating instructions in this manual.

B. BTU & Efficiency Specifications

| EPA Report #:                     | 114-18 (without catalyst)  |
|                                  | 115-18 (catalytic)         |
| EPA Certified Emissions:         | .6 g/hr (without catalyst) |
|                                  | .3 g/hr (catalytic)        |
| *LHV Tested Efficiency:          | 80.3% (without catalyst)   |
|                                  | 82.8% (catalytic)          |
| **HHV Tested Efficiency:         | 74.3% (without catalyst)   |
|                                  | 76.7% (catalytic)          |
| ***EPA BTU Output:               | 12,500 - 18,500 (without catalyst) |
|                                  | 10,700 - 16,000 (catalytic) |
| ****Peak BTU/Hour Output:        | 36,900 (without catalyst)   |
|                                  | 34,900 (catalytic)         |
| Vent Size:                       | 6 Inch (152 mm)            |
| Firebox Size:                    | 1.3 cu. ft.                |
| Recommended Length:              | 14”                        |
| Max. Wood Length:                | 15”                        |
| Fuel Orientation:                | East, West                 |
| Fuel                             | Seasoned Cordwood (20% moisture) |

* Weighted average LHV efficiency using Douglas Fir dimensional lumber and data collected during EPA emissions test.

**Weighted average HHV efficiency using Douglas Fir dimensional lumber and data collected during EPA emissions test.

***Efficiencies are based on test results calculated using B415; these calculated efficiencies are then used to calculate output BTU’s.

****A peak BTU out of the appliance calculated using the maximum first hour burn rate from the High EPA Test and the BTU content of cord wood (8600) times the efficiency.

C. Mobile Home Approved (USA ONLY)

- This appliance is approved for mobile home installations in the USA when not installed in a sleeping room and when an outside combustion air inlet is provided.
- The structural integrity of the mobile home floor, ceiling, and walls must be maintained.
- The unit must be bolted to the floor. This can be done using an appropriate fastener for the application.
- The appliance must be properly grounded to the frame of the mobile home with #8 copper ground wire, and chimney must be listed to UL103 HT or a listed UL-1777 full length six” (152mm) diameter liner must be used.
- Outside air must be installed in a mobile home installation.
- Mobile Home Bracket Kit #0003264 must be installed in a mobile home installation.

D. Glass Specifications

This appliance is equipped with 5mm ceramic glass. Replace glass only with 5mm ceramic glass. Please contact your dealer for replacement glass.

⚠️ WARNING

Fire Risk.

Hearth & Home Technologies disclaims any responsibility for, and the warranty will be voided by, the following actions:

- Installation and use of any damaged appliance.
- Modification of the appliance.
- Installation other than as instructed by Hearth & Home Technologies.
- Installation and/or use of any component part not approved by Hearth & Home Technologies.
- Operating appliance without fully assembling all components.
- Operating appliance without legs attached (if supplied with it).
- Do NOT Over fire - If appliance or chimney connector glows, you are over firing.

Any such action that may cause a fire hazard.
**G. California Safety Information**

**WARNING**

This product and the fuels used to operate this product (wood), and the products of combustion of such fuels, can expose you to chemicals including carbon black, which is known to the State of California to cause cancer, and carbon monoxide, which is known to the State of California to cause birth defects or other reproductive harm. For more information go to: [www.P65Warnings.ca.gov](http://www.P65Warnings.ca.gov)

---

Improper installation, adjustment, alteration, service or maintenance can cause injury or property damage.

For assistance or additional information, consult a qualified installer, service agency or your dealer.

---

NOTE: Hearth & Home Technologies, manufacturer of this appliance, reserves the right to alter its products, their specifications and/or price without notice.

---

NOTE: This installation must conform with local codes. In the absence of local codes you must comply with the UL1482-11, UL 737-11, (UM) 84-HUD and NPFA211 in the U.S.A. and the ULC S627-00 and CAN/CSA-B365 Installation Codes in Canada. **NOT APPROVED FOR MOBILE HOME INSTALLATIONS IN CANADA!**

---

Hearth & Home Technologies WILL NOT warranty appliances that exhibit evidence of firing. Evidence of firing includes, but is not limited to:

- Warped Damper
- Deteriorated refractory
- Deteriorated interior components

**E. Non-Combustible Materials**

Material which will not ignite and burn, composed of any combination of the following:

- Steel
- Brick
- Concrete
- Glass
- Plaster
- Iron
- Tile
- Slate

Materials reported as passing **ASTM E 136, Standard Test Method for Behavior of Metals, in a Vertical Tube Furnace of 750° C.**

**F. Combustible Materials**

Material made of/or surfaced with any of the following materials:

- Wood
- Compressed Paper
- Plant Fibers
- Plastic
- Plywood/OSB
- Sheet Rock (drywall)

Any material that can ignite and burn: flame proofed or not, plastered or non-plastered.
A. Design and Installation Considerations
Consideration must be given to:
- Safety
- Convenience
- Traffic flow
- Chimney and chimney connector required

It is a good idea to plan your installation on paper, using exact measurements for clearances and floor protection, before actually beginning the installation. If you are not using an existing chimney, place the appliance where there will be a clear passage for a factory-built listed chimney through the ceiling and roof.

We recommend that a qualified building inspector and your insurance company representative review your plans before and after installation.

If this appliance is in an area where children may be near it is recommended that you purchase a decorative barrier to go in front of the appliance. Remember to always keep children away while it is operating and do not let anyone operate this appliance unless they are familiar with these operating instructions.

B. Fire Safety
To provide reasonable fire safety, the following should be given serious consideration:

1. Install at least one smoke detector on each floor of your home to ensure your safety. They should be located away from the heating appliance and close to the sleeping areas. Follow the smoke detector manufacturer’s placement and installation instructions, and be sure to maintain regularly.

2. A conveniently located Class A fire extinguisher to contend with small fires resulting from burning embers.

3. A CO detector should be installed in the room with the appliance.

4. A practiced evacuation plan, consisting of at least two escape routes.

5. A plan to deal with a chimney fire as follows:
   **In the event of a chimney fire:**
   a. Evacuate the house immediately
   b. Notify fire department.

Notice: Hearth & Home Technologies assumes no responsibility for the improper performance of the appliance system caused by:
- Inadequate draft due to environmental conditions
- Down drafts
- Tight sealing construction of the structure
- Mechanical exhausting devices
- Over drafting caused by excessive chimney heights
- Ideal performance is with a chimney height of 16 Feet (4.88m) measured from the base of the appliance.

C. Negative Pressure

Negative pressure results from the imbalance of air available for the appliance to operate properly. It can be strongest in lower levels of the house.

**Causes include:**
- Exhaust fans (kitchen, bath, etc.)
- Range hoods
- Combustion air requirements for furnaces, water appliances and other combustion appliances
- Clothes dryers
- Location of return-air vents to furnace or air conditioning
- Imbalances of the HVAC air handling system
- Upper level air leaks such as:
  - Recessed lighting
  - Attic hatch
  - Duct leaks
To minimize the effects of negative air pressure:

- Install unit with outside air with the intake facing prevailing winds during the heating season
- Ensure adequate outdoor air for all combustion appliances and exhaust equipment
- Ensure furnace and air conditioning return vents are not located in the immediate vicinity of the appliance
- Avoid installing the appliance near doors, walkways or small isolated spaces
- Recessed lighting should be a "sealed can" design
- Attic hatches weather stripped or sealed
- Attic mounted duct work and air handler joints and seams taped or sealed
- Basement installations should be avoided

E. Inspect Appliance and Components

- Remove appliance and components from packaging and inspect for damage.
- Report to your dealer any parts damaged in shipment.
- Read all the instructions before starting the installation. Follow these instructions carefully during the installation to ensure maximum safety and benefit.

D. Tools And Supplies Needed

Before beginning the installation be sure the following tools and building supplies are available:

- Reciprocating saw
- Pliers
- Hammer
- Phillips screwdriver
- Flat blade screwdriver
- Plumb line
- Level
- Misc. screws and nails
- 1/2-3/4 in. length, #6 or #8 self-drilling screws
- Framing material
- High temp caulking material
- Gloves
- Framing square
- Electric drill and bits
- Safety glasses
- Tape measure

WARNING

Fire Risk
Hearth & Home Technologies disclaims any responsibility for, and the warranty will be voided by, the following actions:

- Installation and use of any damaged appliance.
- Modification of the appliance.
- Installation other than as instructed by Hearth & Home Technologies.
- Installation and/or use of any component part not approved by Hearth & Home Technologies.
- Operating appliance without fully assembling all components.
- Operating with the front doors open.
- Operating appliance without legs attached (if supplied with appliance).
- Do NOT Over fire - If appliance or chimney connector glows, you are over firing.

Any such action that may cause a fire hazard.

WARNING

When this room heater is not properly installed, a house fire may result. To reduce the risk of fire, follow the installation instructions. Contact local building or fire officials about restrictions and installation inspection requirements in your area.
**F. Install Checklist**

**ATTENTION INSTALLER:**

Follow this Standard Work Checklist

This standard work checklist is to be used by the installer in conjunction with, not instead of, the instructions contained in this installation manual.

Customer: 

Date Installed: 

Lot/Address: 

Location of Appliance: 

Installer: 

Dealer/Distributor Phone #:

(BUILDER/GEN. CONTRACTOR) (INSTALLER) (DATE)
3 Dimensions and Clearances

A. Appliance Dimensions

**NOTE:** Flue Collar size is 6” (152mm) diameter (ID)

![Figure 3.1 - Front View](image1)

![Figure 3.2 - Top View](image2)

![Figure 3.2 - Side View](image3)

![Figure 3.4 - Side View with horizontal flue](image4)
B. Hearth Protection Requirements

FLOOR PROTECTION: It is necessary to install a Type I floor protector.

In the US: The unit may be installed on a combustible floor if the bottom heat shield is installed and non-combustible spark & ember protection is used. The bottom heat shield is required unless the unit will be installed on a completely non-combustible surface (example: unpainted concrete over bare earth). There is no required R or K value. The floor protector should extend 8” (203 mm) from either side of the loading door, 16” (406 mm) from the front of the unit and 6” (152 mm) to the rear of the unit. The floor protector must extend underneath any horizontal run of chimney connector and extend 2” (51mm) beyond each side.

In Canada, similar floor protection must be provided 18” (457 mm) in front, 8” (203 mm) from the sides and 6” (152 mm) to the rear of the appliance. Figure 3.8

*EXCEPTION: Non-combustible floor protections must extend beneath the flue pipe when installed with horizontal venting and extend 2” (51 mm) beyond each side. See Figure 3.7.

![Fire Risk]

WARNING

Fire Risk

Hearth pads must be installed exactly as specified. High temperatures or hot embers may ignite concealed combustibles.

For Factory Alcove: 6" diameter listed Double wall air insulated connector pipe with UL103 HT listed factory built Class A Chimney or Masonry chimney. Maximum depth Alcove shall be no more than 48" (1219 mm) and the referenced Alcove clearances. Canada must comply with CAN/ULC-S269 M87 for the 650° factory built chimney.

*Follow pipe manufacturers clearances as required.

1. The connector pipe heat shield must extend 36" (914 mm) above flue collar.
2. The Intrepid Flexburn was not tested for clearances to protected surfaces. For clearance reduction methods, refer to NFPA 211 or Local Codes.

---

**WARNING**

**Fire Risk**

- Comply with all minimum clearances to combustibles as specified.
- Failure to comply may cause house fire.

---

Figure 3.9

---

Figure 3.10
D. Fireplace Installation

Shallow Installation

If the unit is not installed completely within the fireplace:

Maximum projection of unit out of the fireplace is 12". The minimum clearance to a mantle is shown below.

![Shallow Install](image)

**Figure 3.11**

Full Installation

If the unit is completely installed in the firebox (unit face flush or behind fireplace front) the minimum clearance to the mantle is shown below.

![Full Install](image)

**Figure 3.12**

Disclaimers:

- Extended floor protection may be required for shallow installs, follow floor protection requirements.
- Full insertion installation may not allow use of the top load door depending on the fireplace height.
E. Locating Your Appliance & Chimney
Location of the appliance and chimney will affect performance. As shown in Figure 3.13 the chimney should:

- Install through the warm space enclosed by the building envelope. This helps to produce more draft, especially during lighting and die down of the fire.
- Penetrate the highest part of the roof. This minimizes the affects of wind turbulence and down drafts.

- Consider the appliance location in order to avoid floor and ceiling attic joists and rafters.
- Locate termination cap away from trees, adjacent structures, uneven roof lines and other obstructions.

Your local dealer is the expert in your geographic area and can usually make suggestions or discover solutions that will easily correct your flue problem.

F. Chimney Termination Requirements
Follow manufacturer’s instructions for clearance, securing flashing and terminating the chimney. Figures 3.14 & 3.15.

- Must have an approved and Listed cap
- Must not be located where it will become plugged by snow or other material
- Must terminate at least 3 feet (91 cm) above the roof and at least 2 feet (61 cm) above any portion of the roof within 10 feet (305 cm).
- Must be located away from trees or other structures

**NOTICE:** Locating the appliance in a basement or in a location of considerable air movement can cause intermittent smoke spillage from appliance. Do not locate appliance near

- Frequently open doors
- Central heat outlets or returns

**NOTICE:**

- Chimney performance may vary.
- Trees, buildings, roof lines and wind conditions affect performance.
- Chimney height may need adjustment if smoking or overdraft occurs.
G. Chimney Location (2-10-3 Rule)

These are safety requirements and are not meant to assure proper flue draft.

This appliance is made with a 6” (152 mm) diameter chimney connector as the flue collar on the appliance.

- Changing the diameter of the chimney can affect draft and cause poor performance.
- It is not recommended to use offsets and elbows at altitudes above 4000 feet above sea level and or when there are other factors that affect flue draft.

![Diagram of chimney location](image)

**Figure 3.14**

![Diagram of chimney location](image)

**Figure 3.15**
A. Venting & Draft Management

A stove is part of a system, which includes the chimney, the operator, the fuel, and the home. The other parts of the system will affect how well the stove works. When there is a good match between all the parts, the system works well.

Wood stove or insert operation depends on natural (unforced) draft. Natural draft occurs when the exhaust is hotter (and therefore lighter) than the outdoor air at the top of the chimney. The bigger the temperature difference, the stronger the draft. As the hot gases rise through the chimney they provide suction or ‘draw’ that pulls air into the stove for combustion. A slow, lazy fire with the stove’s air inlets fully open indicates a weak draft. A brisk fire, supported only by air entering the stove through the normal inlets, indicates a good draft. The stove’s air inlets are passive; they regulate how much air can enter the stove, but they don’t move air into it.

Depending on the features of your installation - steel or masonry chimney, inside or outside the house, matched to the stove’s outlet or oversized - your system may warm up quickly, or it may take a while to warm up and operate well. With an ‘airtight’ stove, one which restricts the amount of air getting into the firebox, the chimney must keep the stove’s exhaust warm all the way to the outdoors in order for the stove to work well. Some chimneys do this better than others. Here’s a list of features and their effects.

Masonry Chimney

Masonry is a traditional material for chimneys, but it can perform poorly when it serves an ‘airtight’ stove. Masonry is a very effective ‘heat sink’ - it absorbs a lot of heat. It can cool the chimney gases enough to diminish draft. The bigger the chimney, the longer it takes to warm up. It’s often very difficult to warm up an outdoor masonry chimney, especially an oversized one, and keep it warm enough to maintain an adequate draft.

Steel Chimney

Most factory-made steel chimneys have a layer of insulation around the inner flue. This insulation keeps the chimney warm. The insulation is less dense than masonry, so a steel chimney warms up more quickly than a masonry chimney. Steel doesn’t have the good looks of masonry, but it performs much better.

Indoor/Outdoor Location

Because the chimney must keep the smoke warm, it’s best to locate it inside the house. This uses the house as insulation for the flue and allows some heat release into the home. An indoor chimney won’t lose its heat to the outdoors, so it takes less heat from the stove to heat it up and keep it warm.

Single Venting

Each ‘airtight’ stove requires its own flue. If an airtight stove is vented to a flue that also serves an open fireplace, or a leakier stove, it’s easier for the chimney draft to pull air in through those channels and performance of the stove suffers. Imagine a vacuum cleaner with a hole in the hose to understand the effect here. In some cases the other appliance can even cause a negative draft through the stove, and result in a dangerous draft reversal.

Chimney Height

The common wisdom tells us that a taller flue draws better than a short one. This isn’t necessarily so. If a chimney is tall enough to meet the safety requirements of the 2/3/10 foot rule, then adding more height isn’t the right answer to a draft problem. In fact it could make the problem worse by adding more mass to the chimney system, which must be warmed up, a distance from the heat source (the stove). Don’t make a chimney taller unless you must in order to meet the safety rules, or unless there’s some nearby feature causing a downdraft. Even then, there are downdraft-preventing chimney caps available, which are probably the smarter choice.

Flue Sizing

The inside size of a chimney for an ‘airtight’ stove should match the size of the stove’s flue outlet. When a chimney serves an airtight stove, more is not better; in fact, it can be a disadvantage. Hot gases lose heat faster as they travel slower through a chimney; if we vent a stove with a six-inch flue collar (28 square inch area) into a 10 x 10” flue, the gases slow to one third their original speed. This allows the gases to cool more rapidly, which weakens draft strength. If an oversized flue is also outside the house, the heat it absorbs gets transferred to the outdoor air and the flue usually stays cool.

It is common for a masonry flue, especially one serving a fireplace, to be oversized for the stove. It can take quite a while to warm up such a flue, and the results can be disappointing. The best solution to an oversized flue is an insulated steel chimney liner, the same diameter as the stove or inserts flue outlet; the liner keeps the exhaust warm, and the result is a stronger draft. An non-insulated liner is a second choice - the liner keeps the exhaust restricted to its original size, but the hot gases still must warm up the air around the liner. This makes the warm-up process take longer.

Pipe & Chimney Layout

Every turn the exhaust must take as it travels to the chimney top will slow it down. The ideal pipe and chimney layout is to vent vertically into a completely straight and vertical chimney. If you are starting from scratch, use this layout if possible. If the stovepipe must elbow to enter a chimney, locate the thimble about midway between the stove top and the ceiling. This achieves several goals: it allows the gases to speed up before they must turn, it leaves some pipe in the room for heat transfer, and it gives you long-term flexibility for installing a different stove without relocating the thimble.

There should be no more than eight feet of single-wall stove pipe between the stove and a chimney; longer runs can cool the exhaust enough to cause draft and creosote problems. With prefabricated chimney, bring it down to six to eight feet from the stove. With a masonry chimney, arrange the pipe so that it turns into the chimney within eight feet of the stove.
B. Venting Components

Chimney Connector: It is also known as flue pipe or appliance pipe. The chimney connector joins the appliance to the chimney. It must be a 6” (152 mm) minimum diameter 24 gauge mild steel black or 26 gauge blued steel, or an approved air-insulated double wall venting pipe.

Thimble: A manufactured or site-constructed device installed in combustible walls through which the chimney connector passes to the chimney. It is intended to keep the walls from igniting. Site constructed thimbles must meet NFPA 211 Standards. Prefabricated must be suitable for use with selected chimney and meet UL103 Type HT Standards. Follow instructions provided by the manufacturer for manufactured thimbles for masonry chimney and prefabricated chimneys.

Chimney: The chimney can be new or existing, masonry or prefabricated and must meet the following minimum requirements specified in section 4C “Chimney Systems”.

C. Chimney Systems

Prefabricated Metal Chimney
- Must be minimum 6” (152 mm) diameter (ID) high temperature chimney listed to UL 103 HT (2100 °F) or ULC S629M.
- Must use components required by the manufacturer for installation.
- Must maintain clearances required by the manufacturer for installation.
- Refer to manufacturers instructions for installation.

NOTE: In Canada when using a factory-built chimney it must be safety listed, Type UL103 HT (2100 °F) CLASS “A” or conforming to CAN/ULC-S629M, STANDARD FOR 650 °C FACTORY-BUILT CHIMNEYS.
Thimble
Site constructed for masonry chimney installation:

Components

- A minimum length of 12” (305 mm) (longer for thicker walls) of solid insulated factory-built chimney length constructed to UL 103 Type HT 6” (152 mm) inside diameter. Chimney needs to extend a minimum of 2” (51 mm) from the interior wall and a minimum of 1” (25 mm) from the exterior wall.
- Wall spacer, trim collar and wall band to fit solid pack chimney selected.
- Minimum 8” (203 mm) diameter clay liner section (if not already present in chimney) and refractory mortar.
- When jurisdiction requires install approved chimney liner in masonry chimney.

Air Clearances

- Masonry chimney clearance must meet NFPA 211 minimum requirement of 2” (51 mm) to sheet metal supports and combustibles.
- Minimum of 1” (25 mm) clearance around the chimney connector.
- Top of wall opening is a minimum of 13-1/2” (343 mm) from ceiling or 4-1/2” (114 mm) below minimum clearance specified by chimney connector manufacturer. NFPA 211 minimum vertical clearance of 18” (457 mm) from chimney connector and ceiling or minimum recommended by chimney connector manufacturer. Figure 4.3

Instructions

1. Open inside wall at proper height for the chimney connector to enter the masonry chimney. Figure 4.3
2. Entry hole to masonry chimney must be lined with an 8” (203 mm) minimum diameter clay liner, or equivalent, secured with refractory mortar.
3. Construct a 17” x 17” (432 mm x 432 mm) outside dimension frame from 2 x 2 framing lumber to fit into wall opening. Inside opening of frame should be no less than 14” x 14” (356 mm x 356 mm). Figure 4.4. Attach the wall spacer to the chimney side of the frame.
5. Nail the frame into the wall opening. The spacer should be on the chimney side.
6. Insert the section of the solid insulated chimney into the outer wall of the masonry chimney.
7. Tightly secure the length of the solid insulated chimney with the wall band to the masonry chimney.
8. Insert a section of chimney connector into the chimney. Make sure it does not protrude past the edge of the clay chimney liner inside the chimney.
9. Seal the end of the chimney connector to the clay liner with refractory mortar.
10. Install trim collar around the sold pack chimney section.

WARNING

Fire Risk
Do NOT pack insulation or other combustibles between spacers.
- ALWAYS maintain specified clearances around venting and spacers.
- Install spacers as specified.
Failure to keep insulation or other material away from vent pipe may cause fire.
Chimney Height / Rise and Run

This product was designed for and tested on a 6” (152mm) chimney, 16 feet (4.88m) high, (includes appliance height) measured from the base of the appliance. The further your stack height or diameter varies from this configuration, the possibility of performance problems exists.

Chimney height may need to be increased by 2 - 3% per each 1000 feet above sea level. It is not recommended to use offsets or elbows at altitudes above 4000 feet above sea level or when there are other factors that affect flue draft.

**WARNING**

Fire Risk

Inspection of Chimney:
- Chimney must be in good condition.
- Meets minimum standard of NFPA 211
- Factory-built chimney must be 6” (152mm) UL103 HT.

**WARNING**

Asphyxiation Risk

- **DO NOT CONNECT THIS Appliance TO A CHIMNEY FLUE SERVICING ANOTHER APPLIANCE.**
- **DO NOT CONNECT TO ANY AIR DISTRIBUTION DUCT OR SYSTEM.**

May allow flue gases to enter the house.

**WARNING**

Improper installation, adjustment, alteration, service or maintenance can cause injury or property damage. Refer to the owner’s information manual provided with this appliance. For assistance or additional information consult a qualified installer, service agency or your dealer.

---

**D. Installing Chimney Components**

**Chimney Connector**

**Single wall connector or appliance pipe**

This must be at least 24 gauge mild steel or 26 gauge blue steel. The sections must be attached to the appliance and to each other with the crimped (male) end pointing toward the appliance. All joints, including the connection at the flue collar, should be secured with 3 sheet metal screws. Make sure to follow the minimum clearances to combustibles. Where passage through the wall, or partition of combustible construction is desired in Canada, the installation shall conform to CAN/CSA-B365.

**Factory-built (Double-Wall) listed chimney connector**

A listed connector (vented) must be used when installing this appliance in a mobile home. The listed connectors must conform to each other to ensure a proper fit and seal.

**Secure pipe sections with a minimum of 3 screws**

**Figure 4.6 - Chimney Connector (Appliance Pipe)**

---

![Diagram of Chimney Connector](image_url)
A. Removing Unit from Skid

Remove the unit from the shipping brackets by removing (2) 1/4-20 hex head bolts from each shipping bracket, leaving brackets attached to the skid. Figure 5.1. (Save the 1/4-20 hex head bolts as they will be needed later to install heat shield.)

NOTE: When moving the stove, lift the stove to take weight off the legs whenever possible. Dragging or sliding the stove, especially across rough surfaces can cause the legs to break.

B. Assembly

Set Up Your Stove
Cast iron stoves are heavy, and it will take two to four people to move your Intrepid FlexBurn® into position.

Wipe the protective coating of oil from the griddle with a clean dry rag or a paper towel.

Install the handle on the griddle. Open front door and push up on griddle and assemble the handle. Figure 5.2.

With the handle pointing 45° from its final position, tighten the nut as far as possible with the pliers. Move the handle to its final position while still holding the nut with the pliers.

CAUTION
Overtightening can strip tapped threads.

Install the Bottom Heat Shield

NOTE: The Bottom Heat Shield is required in most installations. Refer to Floor Protection, in the Dimensions and Clearances Section of this manual for further details.

1. Align the bottom heat shield holes with the four bolts removed from the shipping brackets. The outside air cutout hole should be toward the rear of the stove.

2. Pass all four bolts through the large end of the keyholes and then pulling the shield forward to engage the smaller ends of the keyhole slots. (Figure 5.3)

3. Attach the heat shield sides by passing the slots over the bolt heads. Tighten the hex head bolts.

WARNING
The flue collar heat shield must be installed in all vertical installations. The flue collar heat shield is not used when the flue collar is in the rear exit position.

Attach the Damper Handle
Use the 1/4"-20 x 3" screw to attach the damper handle to the damper stub on the left side.

Assemble the Removable Insert Handle
The wooden removable insert handle opens and closes the front doors. Remove after each use, and store it in the handle holder behind the right front leg. Assemble the handle by passing the 3-3/8" screw through the wooden shaft and into the bright metal nub. (Figure 5.5) Tighten carefully until snug.
C. Installing Optional Catalyst (Part #0003260)

1. Locate the access cover positioned at the rear center of the unit. (Figure 5.6)

2. Remove the access cover by pulling straight up and out. (Figure 5.7)

3. Install the catalyst by gently placing it into the cavity and straight down, (Figure 5.8). Place the catalyst where the catalyst’s ceramic components will not be damaged.

Storing the Handle

Use the removable handle to open or close the doors. After using it, remove the handle so it will not get hot. Store the handle in the handle holder installed behind the right front leg. (Figure 5.5)
D. Smoke and CO Detectors & Safety Tips

Smoke and CO Detectors
The use of smoke and carbon monoxide (CO) detectors throughout the home is strongly advised, even if not required by building codes or insurance regulations. It is a good idea to install a smoke detector in the living areas and each bedroom. Follow the smoke/CO detector manufactures placement and installation instructions and maintain regularly.

You may not, however, wish to install a detector in the immediate vicinity of the stove. Depending on the sensitivity of the unit, the alarm can be set off while you are tending the fire or emptying the ashes. If you install a detector in the same room, locate it as far away from the stove as possible.

Safety Tips
Conveniently locate a “Class A” fire extinguisher to contend with small fires. Be sure the fire extinguisher works and is clearly visible. All occupants of the house should know where it is, and how it operates. Have heavy stove gloves available near the stove. Have special safety accessories (e.g., Child Guard Screen) available for use if small children will be in the home.

In the event of a stove pipe or chimney fire….

- Evacuate the house immediately
- Notify the fire department
- If the fire isn’t too threatening, closing down the stove tight, (damper, primary air, all doors) will help to smother the fire.
- Inspect your stove, vent pipe and chimney for any damage caused by the fire and correct any damage before using your stove again.

<table>

<tr>
<th>![WARNING]</th>
</tr>
</thead>
</table>

**Fire Risk**
- Do not leave the fire unattended when the door is unlatched
- Operate only with front doors and ash pan door closed.
- Unstable firewood could fall out of the firebox creating a fire hazard to your home.
E. Reverse the Flue Collar (If necessary)

**Tools Required:** Phillips head screwdriver.

The flue collar is reversible for either a top or rear venting installation. The appliance is shipped with the flue collar in the top vent position.

**Converting Collar For Rear Vent Installation**

1. Remove (4) #10 X 1/2” phillips screws from the rear heat shield. Remove heat shield. Figure 5.11.
2. Remove (2) 1/4-20 X 5/8” button head screws from the flue collar. Remove flue collar. Figure 5.11.
3. Turn flue collar to horizontal position. Inspect rope gasket located on the rear cast housing to ensure a leak free seal. Re-install flue collar. Figure 5.12.

**Note:** The rear heat shield is not used on a rear vent conversion.

---

F. Outside Air Installation

A source of air (oxygen) is necessary in order for combustion to take place. Whatever combustion air is consumed by the fire must be replaced. Air is replaced via air leakage around windows and under doors. In homes that have tightly sealed doors and windows, an outside air source is needed.

**Items Needed for Installation (not supplied)**
- Phillips head screw driver
- Silicone sealant
- 3” Flex or Rigid Duct
- 3” Outside Air Termination Cap with Screen
- Hose Clamps
- Drills and saws necessary for cutting holes through the wall or flooring in your home.

1. Using a #2 Phillips screw driver attach the flex adapter to the appliance using 4 screws. Figure 5.13 & 5.14.
2. Floor & Rear Installation: Cut a 3” (76 mm) hole in outside wall or floor to accommodate outside air piping. Use 3” (76 mm) aluminum metal flex or rigid piping to directly connect outside air to appliance intake. Use a termination cap with a rodent screen (not supplied). Seal between the wall (or floor) and the pipe with silicone to prevent moisture penetration.
Fire Risk

Asphyxiation Risk
Do not draw outside combustion air from:
  • Wall, floor or ceiling cavity
  • Enclosed space such as an attic or garage
  • Close proximity to exhaust vents or chimneys
Fumes or odor may result

Asphyxiation Risk

Outside air inlet must be located to prevent blockage from:
  • Leaves   • Snow or ice   • Other debris
Blockage may cause combustion air starvation
Smoke spillage may set off alarms or irritate sensitive individuals.

Asphyxiation Risk

Length of outside air supply duct shall NOT exceed the length of the vertical height of the exhaust flue.
  • Fire will not burn properly
  • Smoke spillage occurs when door is opened due to air starvation
You must use Mobile Home Bracket Kit Part #0003264 for installation in a mobile home.

1. An outside air inlet must be provided for combustion.

2. Appliance must be secured to the mobile home structure by bolting the legs to the floor.

3. Appliance must be grounded with #8 solid copper grounding wire or equivalent and terminated at each end with N.E.C. approved grounding device.

4. Appliance must be installed with an approved UL103 HT ventilated chimney connector, UL103 HT chimney, and terminal cap with spark arrestor. Never use a single wall connector (appliance pipe) in a mobile home installation. Use only double-wall connector pipe, Dura-Vent DVL, Selkirk Metalbestos DS or Security DL double-wall connector or any listed double-wall connector pipe.

5. Follow the chimney and chimney connector manufacturer’s instructions when installing the flue system for use in a mobile home.

6. Maintain clearance to combustibles.

7. Floor protection requirements must be followed precisely.

8. Use silicone to create an effective vapor barrier at the location where the chimney or other component penetrates to the exterior of the structure.

**NOTE:** Offsets from the vertical, not exceeding 45°, are allowed per Section 905(a) of the Uniform Mechanical Code (UMC). Offsets greater than 45° are considered horizontal and are also allowed, providing the horizontal run does not exceed 75% of the vertical height of the vent. Construction, clearance and termination must be in compliance with the UMC Table 9C. This installation must also comply with NFPA 211.

**NOTE:** Top sections of chimney must be removable to allow maximum clearance of 13.5 feet (411cm) from ground level for transportation purposes.

9. Burn wood only. Other types of fuels may generate poisonous gases (e.g., carbon monoxide).

10. If appliance burns poorly while an exhaust blower is on in home, (i.e., range hood), increase combustion air.

11. Installation shall be in accordance with the Manufacturers Home & Safety Standard (HUD) CFR 3280, Part 24.
