

## CFX-Shield Installation Instructions for model CFX-36T

**NOTE:** This shield is designed to prevent dust and foreign articles from getting into the fireplace in the early stage prior to finishing the house or the place where the unit is installed.

1. Prior to sliding the shield into the front opening of the fireplace, drive two of the screws provided with the shield into the two existing holes located at the bottom right and left corner of the returned bend.
2. Hold the shield at an angle with the returned bend toward you. Drop the two screws mentioned earlier into the two holes on the bottom front face of the unit.
3. Tilt the shield into the opening of the fireplace into a normal vertical position and then drive the two remaining screws provided with the shield into the two existing holes located at the top right and left corner of returned bend on the shield. The screws should go into the clearance holes at the top front face of the unit.
